EXPERIENCE SUMMARY:

Insurance Automation Software:

There are many Insurance companies in Bangladesh are using Insurance Management Software. We are giving various development services to them for long time.

Garments Software:

We have built a wide range of garments related software. We have many clients in this garments sector. Web Based Software: Now a days we are mostly depend on web related

works and web based software solution is getting popularity among various institutes and companies.

Web base applications

We have built many web based solution as like as School/College/University Management Software, Web based ecommerce solutions, Web based payroll software etc. Web Development: We have designed various wonderful web sites for our clients beyond the short time. We work for both locally and internationally.

Branded Bulk SMS:

Bulk SMS is often used in SMS marketing. It is the process of sending SMS messages to a group of opt in customers simultaneously; there are many services that provide these services for countries all over the world. We have huge customers for this unique service in Bangladesh.

Push Pull SMS:

The theory of push pull has been most often applied to marketing processes by businesses and organizations. When these ideas are applied to customer service we can say that a user manual is a type of push customer service and an 800 number helpline would be a pull customer service. Push or pull is defined by whether the customer or the business initiates the activity.

Interactive voice response (IVR /Soft PABX IP Telephone System):

In telecommunications, IVR allows customers to interact with a company's host system via a telephone keypad or by speech recognition, after which they can service their own inquiries by following the IVR dialogue. IVR systems can respond with prerecorded or dynamically generated audio to further direct users on how to proceed. IVR applications can be used to control almost any function where the interface can be broken down into a series of simple interactions. IVR systems deployed in the network are sized to handle large call volumes. IVR technology is also being introduced into automobile systems for hands-free operation. Current deployment in automobiles revolves around satellite navigation, audio and mobile phone systems. It's common in industries that have recently entered the telecommunications industry to refer to an automated attendant as an IVR. The terms, however, are distinct and mean different things to traditional telecommunications professionals, whereas emerging telephony and VoIP professionals often use the term IVR as a catch-all to signify any kind of telephony menu, even a basic automated attendant. The term voice response unit, is sometimes used as well.
